

HTML Help files are *easy* to make with Kiss. Just write your pages and organize them into folders. Kiss does the rest for you by generating the entire table of contents file (*.hhc), the index file (*.hhk), and the (*.hhp) project file. The help file can be compiled and viewed right from the Kiss window. The Contents and Index can be completely regenerated at any time with the click of a button. When your project is compiled, a help window is automatically created for you with the most common features, including a Favorites tab and a toolbar with Hide, Back, Forward, Print, and Options buttons. Kiss also provides a real bonus for developers by generating the complete list of command strings needed to implement context sensitive help in your Liberty BASIC application.

- [Screen shot](#)
- Kiss installs and uninstalls cleanly
- Simple to use
- Includes a detailed help file (created with Kiss of course)
- It's **free**
- Written entirely in Liberty BASIC
- You must have Microsoft HTML Help Workshop installed to use Kiss

Recommended

To make your help authoring even easier try [Nvu](#), a complete web authoring system with a WYSIWYG html editor. It's also completely **free**.
